24(2.4) PHASE I BOOK EXPLOITATION CZECH/2433

International Polarographic Congress. 1st, Prague, 1951

Sborník I. Mezinárodní polarografického sjezdu. Díl 3: Hlavní zprávy přednesené na sjezdu. Proceedings... Vol 3: Reviews Read at the Congress. Praha, Přírodovědecké vyd-vi [1952] 774 p. 2,000 copies printed.

Resp. Ed.: Jiří Koryta, Doctor; Chief Ed. of Publishing House: Milan Skalník, Doctor; Tech. Ed.: Oldřich Duka.

PURPOSE: The book is intended for chemists, chemical engineers, and physiologists.

COVERAGE: The book is a collection of reviews and original papers read at the International Polarographic Congress held in Prague in 1951. Uses of polarography in organic and inorganic analysis, biochemistry, medicine, and industrial chemistry are discussed. In their section, Reviews Read at the Congress, Russian and other German or English translations of each review are presented. In the section, Original Papers Read at the Congress, only those translations in Russian, German, and English which have not been published in Volume I are presented. The following scientists participated in the Congress: the Congress: Professor Wlodek Kozul, Dean of the Faculty of Sciences, Warsaw; Doctor Jaromír Dolanský, Minister of Planning; Professor Jaroslav Hrobový, Chairman of the Congress; and Professor Jaroslav Pukáček, Chairman of the Center for Scientific Research and Technical Development. References follow each paper.

Title : Copper as Activator in NaCl Crystals.

Orig Pub : Ceskosl. casop. fys., 1957, 7, No 2, 187-192; Chekhosl. fiz. zh., 1957, 7, No 3, 359-364.

Abstract : It was established by the polarographic method that copper was always present in a formed NaCl crystals as Cu ions, if it had been introduced as an activator into the crystal by the method of extraction from a NaCl melt containing admixtures of CuCl and CuCl₂; the author attributes it to the thermal dissociation of CuCl₂ in the melt according to the equation $2\text{CuCl}_2 \rightarrow 2\text{CuCl} + \text{Cl}_2$. Should the activator be introduced by diffusion from CuCl₂ powder into a NaCl crystal at 450°, copper would be present as Cu²⁺ and Cu. The distribution of Cu along the length of the

NaCl crystal pulled from a melt with the admixture of 10^{-3} of Cu (mol. part of Cu^+/Na^+) was studied: the crystal parts, which have grown later, contain more Cu . With the decrease of the pulling rate from 0.33 to 0.016 mm/min, the Cu concentration in the crystal decreases to some limit magnitude. The distribution factor of Cu (i.e., the ratio of Cu concentration in the crystal to Cu concentration in the melt) rises with the decrease of Cu concentration in the melt.

Title : Copper as an Activator in NaCl Crystals

Orig Pub : Chekhosl. fiz. zh., 1957, 7, No 3, 359-364

Abstract : NaCl crystals were obtained by drawing from a melt by the methods of Czochralski (Czochralski I., Z.f.fiz. chem., 1918, 92, 219) and Kyropoulos (Kyropoulos, S., Z.f. anorg. Chem., 1926, 154, 308, Z. f. fiz. 1930, 63, 846). The activation of copper was either by drawing the crystal from a melt in which chloride of copper was introduced, or else by diffusion upon heating at 450°C of a plate made of pure NaCl, sprinkled with anhydride CuCl_2 . The concentration and the valence of the copper in the crystal were determined polarographically. In crystals drawn from a melt, in which CuCl , or CuCl_2 was introduced, the copper is present in the monovalent state. In crystals made of melt into which only CuCl_2 was introduced,

Card : 1/2

CZECHOSLOVAKIA/Optics - Luminescence

K-6

Abs Jour : Ref Zhur - Fizika, No 5, 1958, No 11800

the copper is present in the monovalent and bivalent states. In crystals activated by diffusion, the copper is present in the bivalent state, since at a temperature less than 500°C, the CuCl_2 does not decompose into CuCl . In the analysis of a crystal, drawn from a melt containing 10^{-3} parts of copper, it was established that the portion of the crystal, grown later, has a relatively larger concentration of copper; the greater the speed of drawing of the crystal from the melt, the greater the concentration of the copper in the crystal. From the data on the determination of copper in the crystals, drawn from melts with various concentrations, it follows that the less copper in the melt, the greater the coefficient of distribution of copper between the crystal and the melt.

✓ Influence of chlorine on the ~~photoelectron~~ emission and the luminescence of rock salt crystals. Antonín Bohm and Jaroslav Trnka (Czechoslov. Acad. Sci., Prague), Czechoslov. J. Phys. 7, 702-13(1957)(in German).—Very

pure NaCl (spectroscopically tested for Si, Mg, Be, Al, Ti traces) is crystallized from a melt (C.A. 52, 32i) in sintered Al₂O₃ crucibles and annealed for 4 hrs. to room temp. Some are heat-treated at 750°C. for 3 to 12 hrs. in dry Cl₂ gas, others are heated without Cl and cooled to room temp. within 2 hrs. Crystal-powder pellets of identical NaCl with a diam. of 10 mm. and 5 mm. thickness are also prepd. under 2500 kg.-cm.⁻² pressure. In order to measure emission and luminescence, slabs of 0.5 mm. thickness and 0.2 cm.² area are cut from the crystals, wrapped in black paper and exposed, at room temp., to 30-kv. x-rays (x-ray tube AEG50T, focal distance 4 cm.). Thermoemission and thermoluminescence are measured by the method of the point-counter (Bohm, C.A. 48, 8657e; 51, 863d, 864h, 7185d, 11045g). Measurement are made 2 min. after x-irradiation. Results are shown in recorded curves. There are pronounced max. at 520°K. and at 580°K. Another max. is at about 360°K. With plastic deformation and with the pressed pellets, the max. at 520°K. disappear, and a max. at 665°K. occurs. An excess of Cl emphasizes the 520°K. max. as compared to crystals without Cl treatment.

Title : Determination of Calcium in Crystals of Alkali Halides

Orig Pub : Chem. listy, 1957, 51, No 7, 1378

Abstract : The earlier described method (Pribil R., Vicensova E.,
Chem. listy, 1952, 46, 535) was used for the determination
of Ca. According to that method, an equivalent amount of
 Zn^{2+} determined later polarographically is displaced by Ca^{2+}
ions from the complex of Zn with complexone III in NH_4OH
medium. The height of the polarographic wave is deter-
mined by the total Zn^{2+} concentration, which is the sum
of the amount of Zn^{2+} displaced by Ca^{2+} ions, the excessive

Zn^{2+} in the Zn complexonate solution and the amount of Zn^{2+} liberated by Na chloride from the Zn complexonate. But if the method was followed accurately, the concentration of excessive Zn^{2+} ions in the polarographic solution is constant and, therefore, the wave height is directly proportional to the Ca^{2+} concentration. The error of the determination of Ca ($3 \cdot 10^{-5}$ to $5 \cdot 10^{-3}$ M) in NaCl crystals was less than 10%. This method is applicable also to the determination of Ca in KCl crystals.

Title : Luminescence, Coloring, and Exoelectronic Emission of CaF_2 , Colored by Various Means

Orig Pub : Chekhosl. fiz. zh. 1958, 8, No 5, 548-556

Abstract : A complex method was used to investigate the absorption, thermoluminescence (TL), and exoelectronic emission (EE) of various naturally and artificially grown crystals of CaF_2 (ten samples), colored photochemically, additively, or by a combination of both methods, or else those subjected to heat treatment prior to coloring. The measurements were made of the absorption spectrum, the TL spectrum, and a simultaneous measurement of the integral TL and one of the following characteristics: 1) TL at a definite wave length (through a monochromator),

Card 1/3

CZECHOSLOVAKIA/Optics - Luminescence.

K

Abs Jour : Ref Zhur Fizika, No 2, 1960, 4535

2) thermal discoloring, 3) EE. The results for various crystals are quite different. In all the investigated crystals one can, by suitable heat treatment and coloring, attain a situation whereby the principal maximum of thermally stimulated EE are located 370, 480 and 650° K (rate of heating 2°/sec), and the corresponding absorption bands are located near 5800 Å and near 5200 and 3600 Å. The curves of thermal discoloration have qualitatively the same appearance for all wave lengths in the visible and the ultraviolet regions. This is due to the strong overlap of the individual absorption bands and makes it impossible to employ the method of thermal discoloration for a mutual comparison of the maxima of thermally stimulated EE, TL, and absorption. In crystals colored by the combined method, only the first low temperature maxima of TL and EE coincide (440° K). The EE has another strong maximum at 650° K, but the luminescence

Card 2/3

- 110 -

CZECHOSLOVAKIA/Optics - Luminescence.

K

Abs Jour : Ref Zhur Fizika, No 2, 1960, 4535

here is not observed. The spectral composition of TL indicates the important role of impurities of heavy metals in the luminescence process; the 3,850-Å emission band probably belongs to copper. -- Kh.F. Kyaem-bre

TITLE: Contribution to the Study of Thermal Properties of NaCl:Ca Crystals Irradiated With X-rays (Příspěvek ke studiu tepelných vlastností krystalů NaCl:Ca ozářených rentgenem)

PERIODICAL: Československý časopis Pro Fysiku, 1958, Nr 6, pp 738 - 739 (Czech)

ABSTRACT: The difference in the temperature of an uncoloured and a coloured crystal, while both were uniformly heated at the same rate (0.6 °C/sec) was measured. A similar measurement was reported on pure proton-irradiated crystals of NaCl by Kobayashi (Ref 1). The crystals of NaCl in the present work were grown from the melt and the actual concentration of Ca in them was measured by a polarographic method (Ref 3). Cubes of 6 mm were cleaved and both coloured and uncoloured crystals were blackened before they were inserted in the furnace. The coloration was produced by irradiation for two hours by 50 kV 30 mA X-rays. Figure 1 shows the results. The difference in temperatures (ΔT) between a coloured and an uncoloured specimen is plotted as a function of temperature for three samples,

Card1/2

Contribution to the Study of Thermal Properties of NaCl:Ca
Crystals Irradiated With X-rays

containing 0.2, 0.05 and 0.002 mol% Ca, respectively.
 ΔT has a maximum which is larger and occurs at lower
temperatures for crystals containing more Ca. The
sample containing 0.2 mol% Ca shows a maximum difference
in temperature between the uncoloured and the coloured
specimen of 0.14 °C, and this maximum occurs at 400 °K.

TITLE: Instrument for Laboratory Preparation of Single Crystals
from a Melt

PERIODICAL: Chemické listy, 1959, Vol 53, Nr 1, pp 33-34 + 1 plate
(facing p 32)

ABSTRACT: Apparatus is described which has been developed in the
Institute of Technical Physics, Czechoslovak Ac.Sc.,
Prague, for preparing single crystals by drawing from a
melt. The main aim of the author was to eliminate various
disadvantages involved in producing single crystals by
the well-known Kyropoulos method. The here described
apparatus consists of a furnace with a crucible, placed
on a base plate which is rotated regularly and is slowly
lowered; the cooler containing the seed crystal and the
growing crystals is kept stationary. A photograph of the
apparatus is reproduced in Figure 1 (plate facing p 32).
By means of this apparatus single crystals of pure sodium
chloride and of sodium chloride with various admixtures
were produced. The crystal dimensions were up to 30 mm
diameter and about 40 mm long. From these, plates of

TOPIC TAGS: telephone equipment, telephone network, telephone system

ABSTRACT: The circuit of a subscribers set of an electronic duplex line is described in which, in order to distinguish and separate both subscribers, at least two reverse poled pairs of corresponding poled diodes are used each connected in series with the other subscriber instrument. The distinguishing feature of the circuit is that both subscriber instruments are connected in series between the telephone lines through one diode of the first pair of like poled diodes and this circuit is at the same time short circuited by one diode of the second pair of like poled diodes. The subscriber instrument is connected to the second telephone line of the mixing line through the second diode of the second pair of like poled diodes. This circuit is at the same time short circuited by the second diode of the first pair of like poled diodes.

AUTHOR: Bohun, A.; Trnka, J.

TITLE: Diffusion structure of the A absorption band of thallium in KCl crystals

SOURCE: Chekhoslovatskiy fizicheskiy zhurnal, v. 15, no. 7, 1965, 530-532

TOPIC TAGS: potassium chloride, thallium, absorption band, luminescence, luminescence center, physical diffusion

ABSTRACT: The article reports that, in contrast with earlier published data by various authors, the diffusion structure of the A absorption band of thallium in KCl crystals is not as simple as stated in the earlier literature. It is pointed out that if the measurement is made at a lower displacement rate of the wave-lengths (1 Å/sec) and with slower motion of the recording tape (0.85 mm/sec), then the structure of the absorption band will no longer be as smooth as assumed, but will show a sign of consisting of at least two bands. It is thus concluded that the effect of thallium in KCl is similar to that of lead, as investigated by the authors in an earlier paper (Czech. J. of Phys. v. 14 B, 1964, 890). This conclusion, together with some other experimental data on the luminescence of the Tl center in KCl and its similarity to the Pb center in KCl indicates that in thallium, as well as in lead, the luminescence centers are formed by Tl complexes,

Card 1/2

TITLE: The X-ray luminescence of NaCl crystals containing elements of the iron group

PERIODICAL: Chekhoslovatskiy fizicheskiy zhurnal, v. 12, no. 5, 1962, 375-382

TEXT: NaCl crystals containing from 0.01 to 0.1 mole % of Fe, Co, or Ni were grown from solution and from melt. Spectrophotometer curves between 3000 and 7000 Å were obtained of the luminescence emitted by these crystals under X-ray irradiation, at room temperature and at 450°K. Three emission bands were observed in the visible region at 5830Å, 6210Å, 6830Å for Fe; at 5810Å, 6130Å, 6580Å for Co, and at 5820Å, 6130Å, 6700Å for Ni. All crystals, both pure and with added elements, show an emission band of unknown origin at 4300Å. Crystals grown from melt, both pure and with additions also have a band at 3600Å, probably due to hydrolysis products. Co-containing crystals grown from solution and from melt give different relative intensities. This is ascribed to the influence of water on Co-ions. Fe-containing crystals grown from melt emit no bands in the visible region. Slight variations of intensity with temperatures were observed There are 6 figures and 1 table. This is a continuation of previous work cited in the references.

64. The molecular "Muller" atomizer and its use.--J. TUNNA (Science, 28, 113, 1940). The atomizing of liquids of various densities and of fuel oils, and the thickening and drying of materials, is done very well in this atomizer, which is made in Melmen. A description of the apparatus is given. The essential point is that the air or gas enters the valve tangentially, starts rotating, increases its velocity with decreasing cross-section, reaching almost infinite velocity on leaving the valve. The liquid enters the valve straight along the axis. In use, atomizer and suspended particles are introduced into a space where hot air or waste kiln gases are circulating; the suspension is dried very thoroughly to a fine powder; the method can be used for spraying bentonite and ceramic materials. A description of the complete drying plant is given with general data on fuel consumption. A plant without the iron framework and electric motor for the drying of 6,500 lb/hr. of bentonite slip containing 4,400 lb. of H_2O would cost \$150,000. (4 figs.)

"Primary Resistance of Mycobacterium Tuberculosis Against Anti-Tuberculosis Drugs"

Prague, Casopis Lekaru Ceskych, Vol CII, No 29-30, 12 July 1963, pp 793-801.

Abstract [Authors' English summary]: A comparison of the actual incidence of primarily resistant strains of Mycobacterium tuberculosis in various countries is difficult to make due to differences in laboratory techniques. Roughly speaking, resistant strains do not amount to more than 5 percent of all strains, with a tendency to rise. Methods are discussed of preventing the rise of resistant strains. Czechoslovakia is among the countries with a low incidence of the primary resistance. Eighty-seven references, including 4 Czech, 2 Polish, and 2 Russian.

<p><i>ca</i> 15</p> <p>Experiments with synthetic nitrate fertilizers. N. TERRE, VL. PRANTER AND I. SYRISKAL. <i>Vestnik Ch. Akad. Zemel'skoi S. SR</i> (1959); <i>Lit. Chelov. Reshedy</i> 48, No. 6, 9. The fertilizers tried were: synthetic $(NH_4)_2SO_4$ mixt. of $(NH_4)_2SO_4$, NH_4NO_3, $Ca(NO_3)_2$ mixt. of NH_4NO_3, KNO_3 and a nitrate phosphate mixt. All fertilizers were tried on sugar beets. The N fertilizers increased the yield of beets in all cases. For small doses (50 kg. per ha.) the NO_3 forms were more effective than the NH_4 forms; for larger doses (80 kg.) the effects were equalized. Individual fertilizers have an influence upon the sugar content of beets: the mixt. of NH_4NO_3, KNO_3 yielded 19.77% sugar, the lowest yield was 19.16% with $Ca(NO_3)_2$ for doses of 50 kg. N per ha. For 80 kg. N per ha. the sugar content was highest for $(NH_4)_2SO_4$ (19.30%) and lowest for NH_4NO_3, KNO_3 and $Ca(NO_3)_2$ mixt. (18.42%). A higher concn. of N reduces the sugar content.</p> <p style="text-align: right;">FRANK MARKEN</p>

Processes and Properties Most

Solubility of Van Bemmelen's A-specific complex in hydrochloric acid under different conditions of time and amount of acid. H. TUGLA and HAURY (Mitt. Chem. Anst. Zentr., 1919, 5, 177; Proc. Internat. Soc. Soil Sci., 1920, 2, 28).—In the extraction of soils with 20% hydrochloric acid solution (Van Bemmelen) by the use of this complex of acid used or in the period of extraction leads to a steady increase in the amount of material dissolved. During prolonged extraction difficulty in the complex indicates may be decomposed. The conditions of extraction must be adjusted to, since the process is not an exact one and serves merely as a means of comparison of soil properties.

A. G. POLLARD.

28

CA

The influence of soils on the quality of sugar beets and juices. J. Valáško, B. Tůžek, D. Šufertová, J. Pazler and D. Ivančenko. *Listy cukrovar.* 58, 87-91(1940).— After an examn. of weekly analyses of sugar juices reported by 18 sugar factories of Moravia over an interval of several years and correlating them to other available regional analyses, V. states that the chem. constituents of the soil have a greater influence on the purity and non-sugars in sugar juices than have the beet brands and climate. The purity of the juice, the lime content, the color and the reducing substances depended to a large degree on the use of fertilizers. With an excess of N in the fertilizer the sugar beets during a wet season assumed the character of beets raised in dry seasons. The continuous dry character of beets grown in the eastern areas of Moravia is being traced to an unsuitable compn. of the soil as well as to the improper use of fertilizers. Juices from large beets were of a higher purity and filtered better after digestion and satn. than juices from small beets. During the ripening of sugar beets in the field the degree of purity continued to rise. Beets grown in alk. soils (pH 8.0), especially in dry seasons, were susceptible to a dry rot which lowered the sugar concn. about 2% and increased the content of invert sugar; the dry rot was prevented by addns. of D to the soil. Frank Mareš

Report of a 24-year-old woman presenting the Stein-Leventhal syndrome who was treated from her 19th yr. onwards, on account of amenorrhoea, with oestrogenic substances which were repeatedly administered in high dosages. In the course of 4 yr. several endometrial biopsies were taken. In the 1st year the histological picture only showed an increased oestrogenic stimulation without signs of luteinization; in the last 2 yr. the histological picture became more and more that of adenocarcinoma. This diagnosis led, in spite of the youth of the patient, to hysterectomy and bilateral removal of the adnexa followed by roentgen treatment. Paradovsky - Zilina
